You should evaluate **2** student in this team

Introduction

Please follow the rules below:

- ✓ Remain polite, courteous, respectful, and constructive throughout the evaluation process. The well-being of the community depends on it.
- ✓ Identify with the student or group whose work is being evaluated the possible dysfunctions in their project. Take the time to discuss and debate the problems that may have been identified.
- ✓ You must consider that there might be some differences in how your peers might have understood the project's instructions and the scope of its functionalities. Always keep an open mind and grade them as honestly as possible. The pedagogy is useful only if the peer-evaluation is done seriously.

Guidelines

Please follow the guidelines below:

- ✓ Only grade the work that was turned in to the Git repository of the evaluated student or group.
- ✓ Double-check that the Git repository belongs to the student or group. The project is the one expected. Also, check that 'git clone' is used to clone the repository.
- ✓ Check carefully that no malicious aliases were used to replace something that is not the content of the official repository.
- ✓ To avoid any surprises and if applicable, review together any scripts used to facilitate the grading (scripts for testing or automation).
- ✓ If you have not completed the assignment you are going to evaluate, you must read the entire subject prior to starting the evaluation process.
- ✓ Use the available flags to report an empty repository, a non-functioning program, a Norm error, cheating, and so forth. In these cases, the evaluation process ends and the final grade is 0, or -42 in the case of cheating. However, except for cheating, students are strongly encouraged to review together the work that was turned in, in order to identify any mistakes that shouldn't be repeated in the future.
- ✓ Remember that for the duration of the defense, no segfaults or other unexpected, premature, or uncontrolled terminations of the program will be tolerated, else the final grade is 0. Use the appropriate flag.
- ✓ You should never have to edit any file except the configuration file if it exists. If you want to edit a file, take the time to explain the reasons with the evaluated student and make sure both of you are okay with this.
- ✓ You must also verify the absence of memory leaks. Any memory allocated on the heap must be properly freed before the end of execution.
- ✓ You are allowed to use any of the different tools available on the computer, such as leaks, valgrind, or e_fence. In case of memory leaks, tick the appropriate flag.

Mandatory Part

Executable name

Executable name

Check that the project compiles well (without re-link) when you execute the `make` command and that the executable name is `cub3D` . If not, use the invalid compilation flag at the end of the scale.

Yes

No

Configuration file

Check that you can configure ALL the following elements in the configuration file. The formatting has to be as described in the subject.

north texture path ☒ NO

north texture path ☒ NO

east texture path ☒ YES

south texture path ☒ SO

west texture path ✓ WE

floor color ✓ F

ceiling color ✓ C

the map (see subject for the map configuration details)

Points earned

0

Also, check that the program returns an error and exits configuration file is misconfigured (for example an unknown key, double keys, an invalid path..) or if the filename doesn't end with the .cub extension. If not, the defense is over and use the appropriate flag incomplete work, crash....

Yes

No

Technical elements of the display

We're going to evaluate the technical elements of the display. Run the program and execute the following tests. If at least one fails, no points will be awarded for this section. Move to the next one.

A window must open at the launch of the program. A window must open at the launch of the program.

An image representing the inside of a maze must be displayed inside the window.

Hide all or part of the window either by using another window or by using the screen's borders, then minimize the windows and maximize it back. In all cases, the content of the window must remain consistent.

Yes

No

User basic events

In this section, we're going to evaluate the program's user generated events. Execute the 3 following tests. If at least one fails, this means that no points will be awarded for this section. Move to the next one.

Click the red cross at the top left of the window. The window must exit cleanly.

Press the ESC key. The window must close and the program must exit. In the case of this test, we will accept that another key exits the program, for example, Q.

Press the four movement keys (we'll accept WASD or ZQSD keys) in the order of your liking. Each key press must render a visible result on the window, such as a player's movement/rotation.

Points earned

0

Yes

No

Movements

In this section, we'll evaluate the implementation of the player's movement/orientation inside the maze. Execute the 5 following tests. If at least one fails, this means that no points will be awarded for this section.

The player's spawning orientation on the first image must be in accordance with the configuration file, test for each cardinal orientation (N, S, E, W).

Press the left arrow then the right arrow. The player's view must rotate to the left then to the right as if the player's head was moving.

Press W (or Z) then S. The player's view must go forward and then backward in a straight line.

Press A (or Q) then D.

The player's view must go to the left and then to the right in a straight line.

During those four movements, was the display smooth? By smooth we mean is the game "playable" or is it slow.

Yes

No

Points earned**0**

Walls

In this section, we'll evaluate the walls in the maze. Execute the 4 following tests. If at least one fails, this means that no points will be awarded for this section.

The wall's texture vary depending on which compass point the wall is facing (north, south, east, west). Check that the textures on the walls and perspective are visible and correct.

Check that if you modify the path of a wall texture in the configuration file, it modifies the rendered texture when the program is re-executed. Also check that if you set a non-existent path it raises an error.

Check that the floor and ceiling colors are well handled when you modify them in the configuration file.

Yes

No

Error management

In this section, we'll evaluate the program's error management and reliability. Execute the 4 following tests. If at least one fails, this means that no points will be awarded for this section. Move to the next one.

Run the program using numerous arguments and random values. Even if the program doesn't require any arguments, it is critical that those arguments don't alternate or create unhandled errors.

Check that there are no memory leaks. You can use the top or leaks command in another shell to monitor that the memory use is stable. The memory used must not increase each time an action is made.

Roll either your arm or your face on the keyboard. The program must show any strange behaviors and it must stay functional.

Modify the map. The program must not show any strange behaviors and it must stay functional if the map is well configured, if not it must show any strange behaviors.

Bonus Part

When I'll be older I'll be John Carmack

We will look at your bonuses if and only if your mandatory part is excellent. This means that you must complete the mandatory part, beginning to end, and your error management must be flawless, even in cases of twisted or bad usage. So if the mandatory part didn't score all the points during this defense bonuses will be totally ignored.

Look at the subject bonus part and add one point for each bonus implemented and fully functional.

Rate it from 0 (failed) through 5 (excellent)
